

Fractions

(Back to Basics Maths)

Addition, subtraction method:

$$\frac{3}{10} + \frac{4}{5} = \text{X cannot do}$$

Solution?
Make denominator the same

$$\frac{3}{10} + \frac{4}{5} \times 2 = \frac{3}{10} + \frac{8}{10} = \frac{3+8}{10} = \frac{11}{10} = \frac{11}{10} \text{ Answer}$$

SAME

$$\frac{7}{15} - \frac{2}{5} = \text{X cannot do}$$
$$\frac{7}{15} - \frac{2}{5} \times 3 = \frac{7}{15} - \frac{6}{15} = \frac{1}{15} \text{ Answer}$$

SAME

Multiplication method:

$$\frac{8}{3} \times \frac{9}{11} = \frac{8 \times 9}{3 \times 11} = \frac{72}{33} \xrightarrow[\div 3]{\text{Simplify}} \frac{24}{11} = 2\frac{2}{11} \text{ Answer}$$

EASY METHOD!

Fractions

(Back to Basics Maths)

Division method:

$$\frac{3}{12} \div \frac{2}{3} = \text{X easier way to do this}$$

FLIP the SECOND Fraction and multiply instead.

$$\frac{3}{12} \times \frac{3}{2} \overset{\text{Flipped}}{\leftarrow} = \frac{3 \times 3}{12 \times 2} = \frac{9}{24} \overset{\text{simplify}}{\div 3} \left(\frac{3}{8} \right) \text{ Answer!}$$
