

GAMSAT Section 3: Blood Buffer System

For a quick revision of the blood buffer system, watch this: https://www.youtube.com/watch?v=5_S5wZks9v8. Before attempting the GAMSAT-style questions, I recommend revising acid-base chemistry, including buffers and the Henderson-Hasselbalch equation.

Please provide feedback on this resource so I can improve it!

Warm-up Questions:

1) Fill in the blanks:

In human blood, the pH must be kept between pH _____ and _____. Therefore, our blood is slightly a _____. pH is controlled using the b_____ buffer system.

2) Two equilibrium reactions occur as part of the blood's buffer system. What are they? How can we write them to show they are simultaneous and linked?

3) Delete as appropriate:

H₂CO₃ is a weak/strong acid. It forms when O₂/CO₂ dissolved in the blood reacts with water. Levels of H₂CO₃ in the blood are principally controlled by respiration/perspiration/inflammation.

When we breathe out CO₂, the equilibrium moves to the right/left and H₂CO₃ levels decrease/increase. Excess HCO₃⁻ is excreted in sweat/breath/urine by the kidneys.

It is important for the blood pH to stay within a certain range because even slight deviations can cause organ damage/disease/death/all listed options.

GAMSAT Section 3: Blood Buffer System

GAMSAT-style questions:

The pH of the blood can be estimated using the Henderson-Hasselbalch equation given below:

$$\text{pH} = \text{p}K_{\text{a}} + \log_{10} \left(\frac{[\text{A}^{-}]}{[\text{HA}]} \right)$$

HA represents an acid and A^{-} represents its conjugate base.

The bicarbonate buffering system operates in the blood to keep it at approximately pH 7.4. The equilibria are as follows

Question 1

If the ratio of H_2CO_3 to HCO_3^{-} in the blood is 2 to 20, what is the most accurate approximation of pKa?

- A. 7.35
- B. 9.4
- C. 5.4
- D. 6.4

GAMSAT Section 3: Blood Buffer System

Question 2

The pH is found to be 7.2 and the pKa of H₂CO₃ is 6.1.

What is the ratio of H₂CO₃ to HCO₃⁻?

- A. 6:1
- B. 1:1.6
- C. 1.1:1
- D. 1 : 1.1

Question 3

H₂CO₃ forms when CO₂ gas dissolved in the blood reacts with water. The following equation relates the partial pressure of CO₂ (pCO₂), pH and HCO₃⁻ concentration

$$pH = 6.1 + \log \left(\frac{[HCO_3^-]}{0.03 \times pCO_2} \right)$$

If pCO₂ is 100 mmHg and the concentration of H₂CO₃ is 3 mmol/L, what is the pH of the blood?

- A. 6.1
- B. 7.1
- C. 7.4
- D. 6.4

GAMSAT Section 3: Blood Buffer System

Solutions

Warm-up questions:

1. In human blood, the pH must be kept between pH 7.35 and 7.45. Therefore, our blood is slightly **alkaline**. pH is controlled using the **bicarbonate** buffer system.
2. Two equilibrium reactions occur as part of the blood's buffer system. You can write them as follows:

3. H₂CO₃ is a **weak** acid. It forms when **CO₂** dissolved in the blood reacts with water. Levels of H₂CO₃ in the blood are principally controlled by **respiration**.

When we breathe out CO₂ the equilibrium moves to the **right** and H₂CO₃ levels **decrease**. Excess HCO₃⁻ is excreted in **urine** by the kidneys.

It is important for the blood pH to stay within a set range because even slight deviations can cause **organ damage, disease and even death (all listed options)**.

GAMSAT-style questions:

- 1) **D (6.4)**

$$[\text{carbonate}]/[\text{carbonic acid}] = 20/2 = 10$$

$$\log_{10}(10) = 1$$

Substitute data in H-H equation and solve...

$$7.4 = \text{pKa} + 1$$

$$\text{pKa} = 7.4 - 1 = 6.4$$

GAMSAT Section 3: Blood Buffer System

2) **D (1:1.1)**

Substitute data into H-H equation and solve...

$$7.2 = 6.1 + [\text{carbonate}]/[\text{carbonic acid}]$$

$$[\text{carbonate}]/[\text{carbonic acid}] = 7.2 - 6.1 = 1.1$$

$$1.1 = 1.1/1$$

3) **A (6.1)**

$$0.03 \times 100 = 3$$

$$\text{Therefore } [\text{carbonate}]/(0.03 \times p\text{CO}_2) = 3/3 = 1$$

$$\log_{10}(1) = 0$$

$$\text{Therefore pH} = 6.1 + 0 = 6.1$$
